

Sureline® TECH-TIPS

Practical tips for customers working with SURELINE® steel poles.

Issue 1 – 2008

Attachments and fittings for steel poles

BlueScope Steel does not specify particular fittings or attachments for its SURELINE® range of poles. Most electricity authorities have used, or easily adapted their own fittings and attachments to SURELINE® steel poles.

The two main differences between SURELINE® steel poles and other traditional pole types are:

- SURELINE® poles are not tapered
- SURELINE® steel poles are an engineered solution. Every pole is a consistent circular section and all poles made to a particular specification (diameter, length and strength rating) in the standard range will be exactly the same in appearance and performance irrespective of where it is manufactured.

The following images show just a small number of the attachments Australian authorities have been able to use with SURELINE® steel poles
